Tritium Experiments

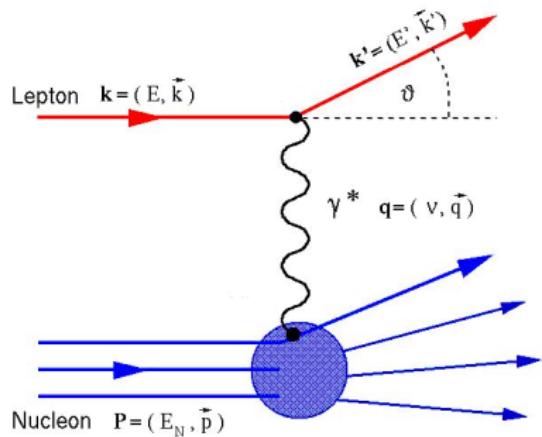

MARATHON

MeAsurement of F_2^n/F_2^p , d/u RAtios and $A = 3$ EMC Effect in Deep Inelastic Electron Scattering off the Tritium and Helium MirrOr Nuclei.

- Lightest and simplest mirror system
 - ▶ Number of protons in 3H = neutrons in 3He
- Differences in the nuclear effects are small
- Improve the current measurement and understanding of F_2^n/F_2^p ratio
- Restrict the assumptions and parameters made in the model calculations of the down to up quark distribution ratio

Deep Inelastic Scattering (DIS)

- $Q^2 \equiv 4EE' \sin^2 \frac{\theta}{2}$
- $X_{Bj} = \frac{Q^2}{2\nu M}$
- $\sigma_{eN} = \frac{\alpha^2}{eE^2 \sin^4(\frac{\theta}{2})} \left[\frac{F_2}{\nu} \cos^2 \frac{\theta}{2} + \frac{2F_1}{M} \sin^2 \frac{\theta}{2} \right]$
- $W^2 = 2M\nu + M^2 - Q^2$
- $W^2 > 4 \rightarrow \text{DIS}$

SLAC/CERN Data Interpretation in QPM

- Nachtmann inequality satisfied: $1/4 \leq F_2^n / F_2^p \leq 4$

- For $x \rightarrow 0$: $F_2^n / F_2^p \rightarrow 1$: Sea quarks dominate with:

$$u + \bar{u} = d + \bar{d} = s + \bar{s}$$

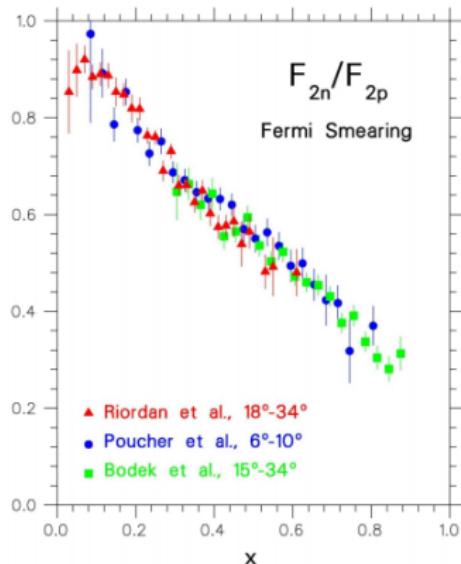

- For $x \rightarrow 1$: $F_2^n / F_2^p \rightarrow 1/4$: High momentum partons in proton (neutron) are up (down) quarks, and:

$$s + \bar{s} = 0$$

- For medium and high x , safe to assume that (with d and u denoting now quark plus antiquark distributions):

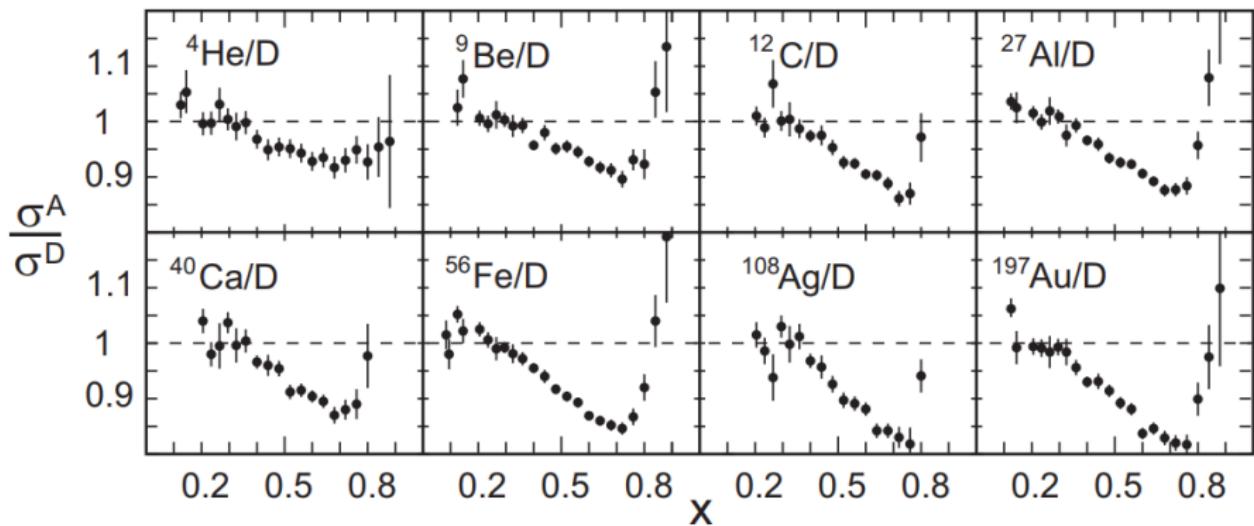

$$\frac{F_2^n}{F_2^p} = \frac{[1 + 4(d/u)]}{[4 + (d/u)]}$$

EMC Effect

SLAC experiment E139 [J. Gomez et al., 1994] .

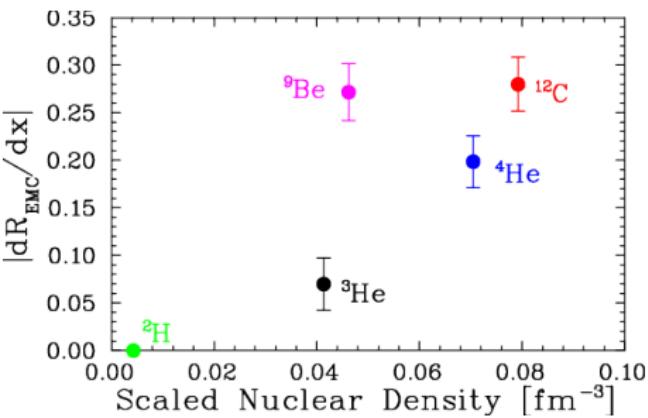

EMC Effect

JLab experiment E03103
 [J.Seely, A. Daniel et al]

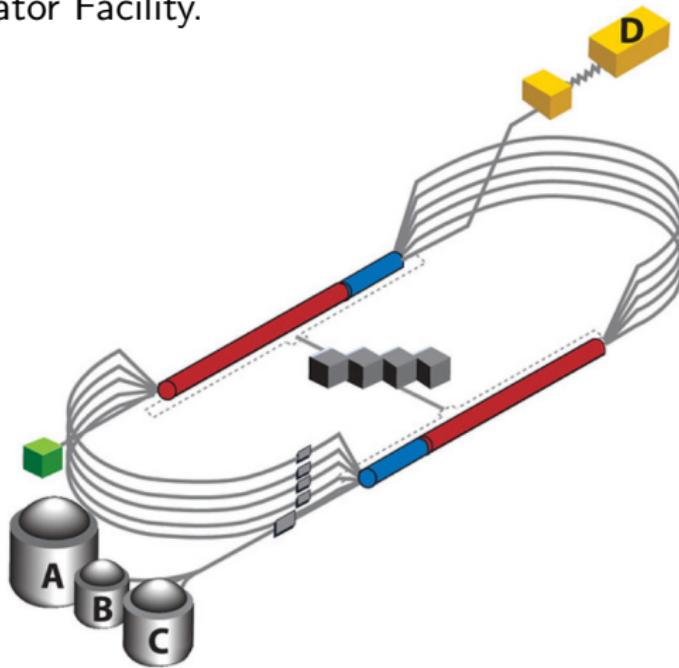

EMC as a function of Nuclear Density.
 [J.Seely, A. Daniel et al]

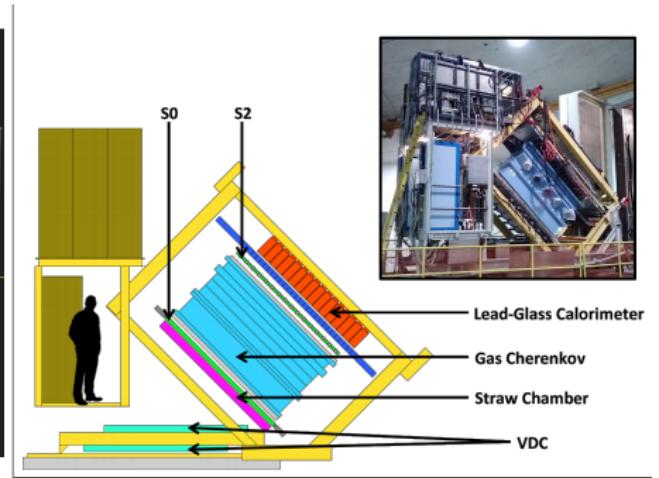

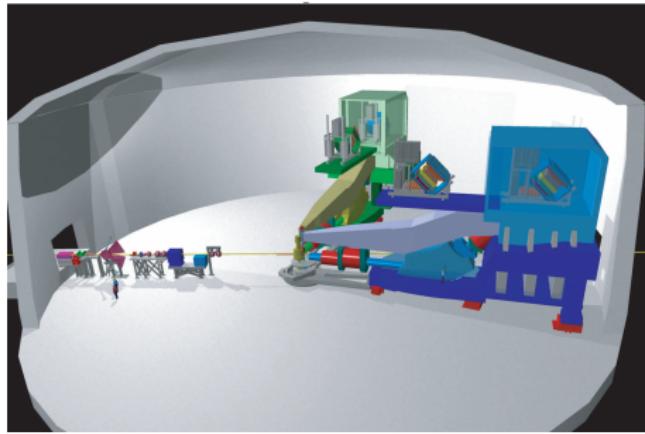

Scaled by $\frac{(A-1)}{A}$

CEBAF

The Continuous Electron Beam Accelerator Facility (CEBAF) at Thomas Jefferson Accelerator Facility.

Hall A & The HRSs

Systematics: 3H Decay

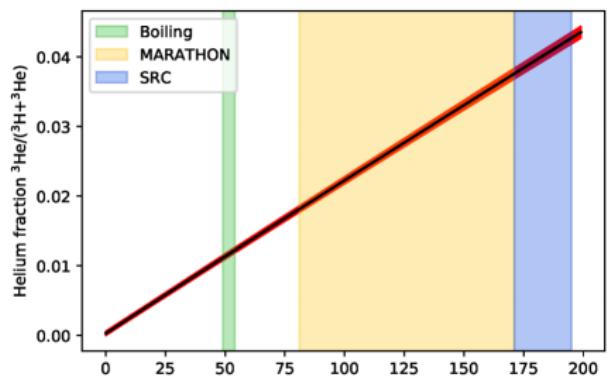

$$\tau(^3H) = 4500 \pm 8 \text{ days}$$

$$c = \frac{\eta_{^3He}}{\eta_{tot}}$$

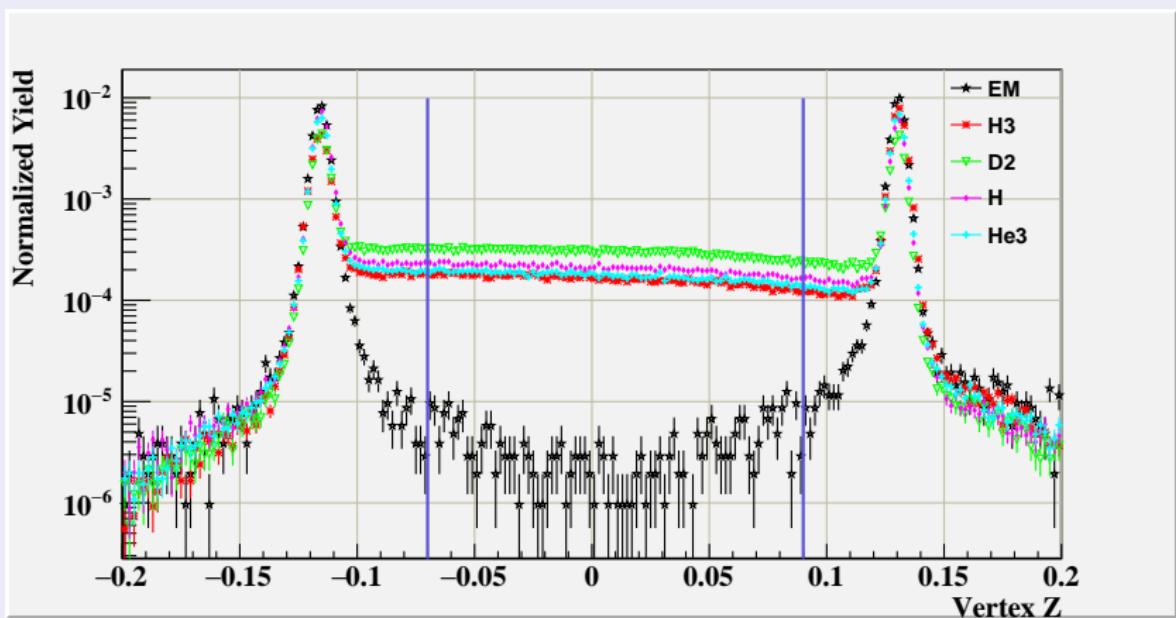

$$\sigma_{^3H} = \left(\frac{\sigma_{tot}}{\sigma_{^3He}} \right) \left(\frac{1}{1 - c} \right) - \left(\frac{1}{1 - c} \right)$$

Beta Decay Helium Fraction

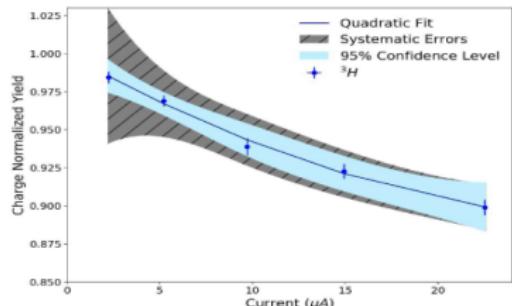

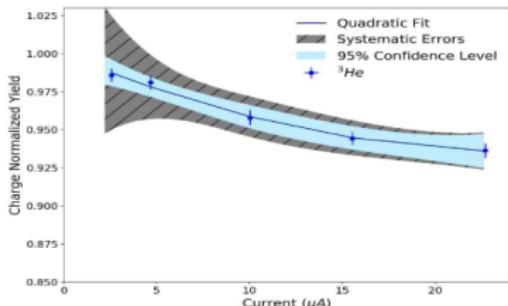

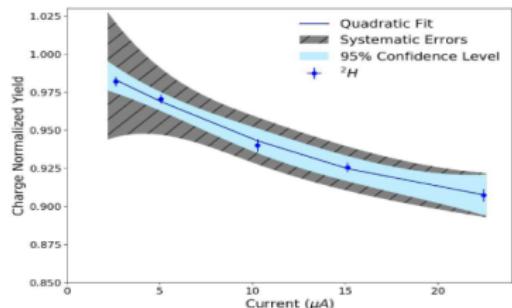

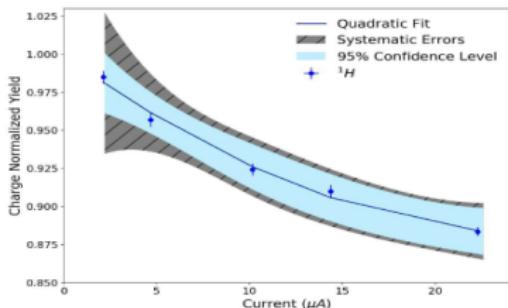

Tyler Kutz

Systematics: Endcaps

- Extract ratio of the normalized yield from the gas cell to that of the empty cell

Systematics: Density Fluctuations

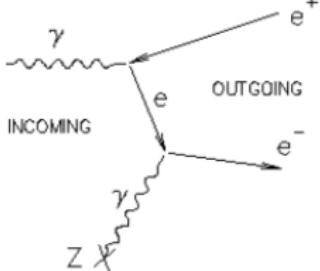

(a) ${}^3\text{H}$ Density Analysis.(b) ${}^3\text{He}$ Density Analysis.(c) ${}^2\text{H}$ Density Analysis.(d) ${}^1\text{H}$ Density Analysis.

[S.N.Santiestebana et. al]

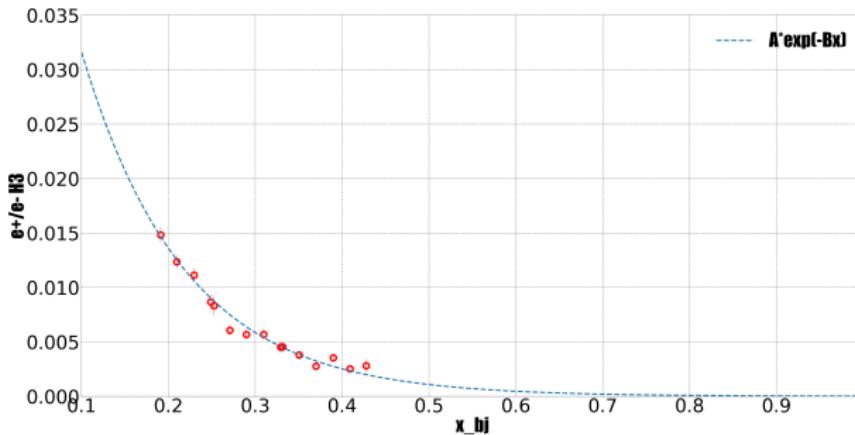

Charge Symmetric back ground

- γ decay into an e^+e^- pairs
- Pair produced $-$ by detecting e^+
- Extraction based on fit to Exponential function

EMC Effect

Extracting F2 ratio

- Form the “SuperRatio” of EMC-type ratios for $A=3$ mirror nuclei:

$$R(^3\text{He}) = \frac{F_2^{^3\text{He}}}{2F_2^p + F_2^n} \quad R(^3\text{H}) = \frac{F_2^{^3\text{H}}}{F_2^p + 2F_2^n} \quad R^* = \frac{R(^3\text{He})}{R(^3\text{H})}$$

- Solve above equations for the $A=3$ structure function ratio:

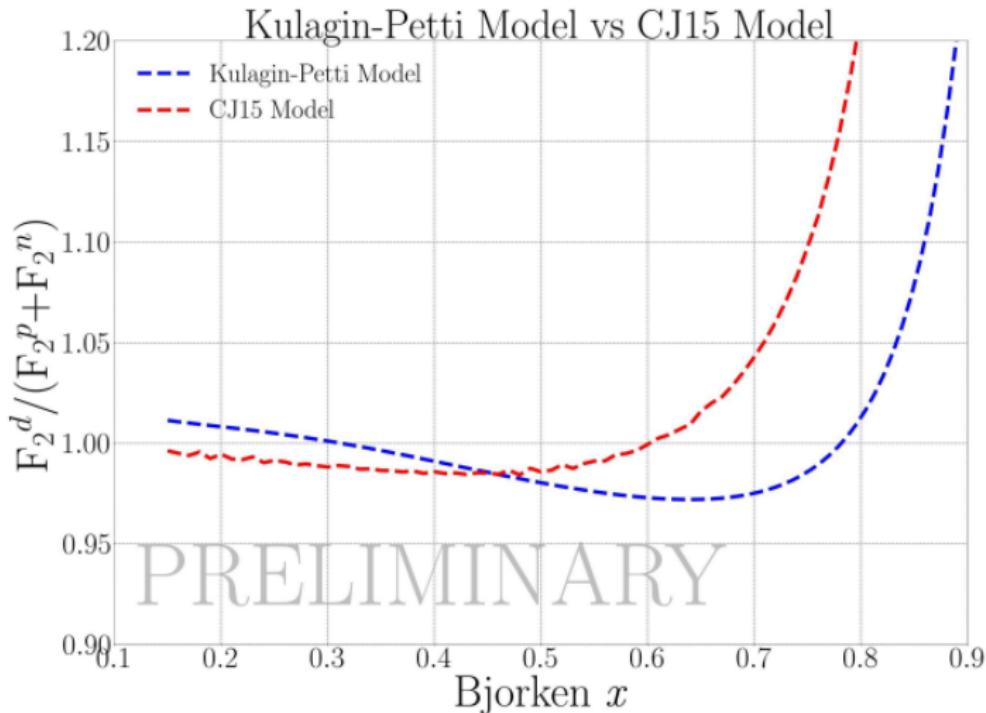

$$\frac{\sigma^{^3\text{He}}}{\sigma^{^3\text{H}}} = \frac{F_2^{^3\text{He}}}{F_2^{^3\text{H}}} = R^* \frac{2F_2^p + F_2^n}{F_2^p + 2F_2^n}$$

- Solve for the nucleon F_2 ratio and calculate it, using R^* from a reliable theoretical model (value of R^* is very close to unity with small uncertainty), and the measured $A=3$ DIS cross section ratio:

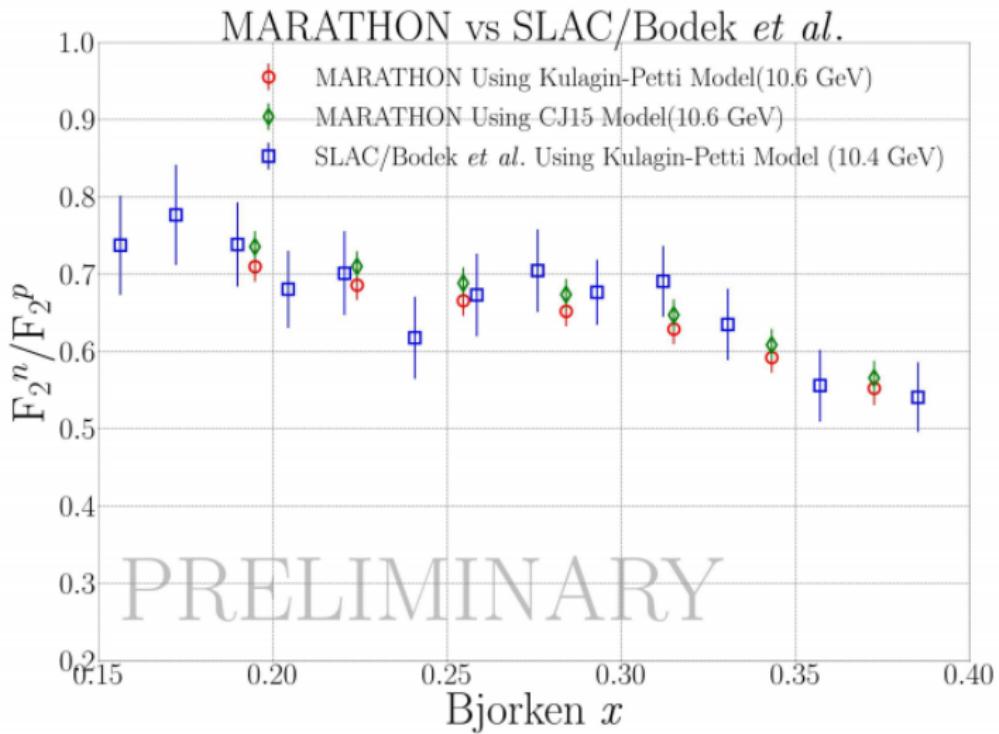

$$\frac{F_2^n}{F_2^p} = \frac{2R^* - \sigma^{^3\text{He}} / \sigma^{^3\text{H}}}{2\sigma^{^3\text{He}} / \sigma^{^3\text{H}} - R^*}$$

- Iterate the process until it converges to a stable F_2^n/F_2^p ratio.
