jbane1@vols.utk.edu

November 19, 2018

Outline

1 EMC Effect

2 MARATHON

- Setup
- Run Period

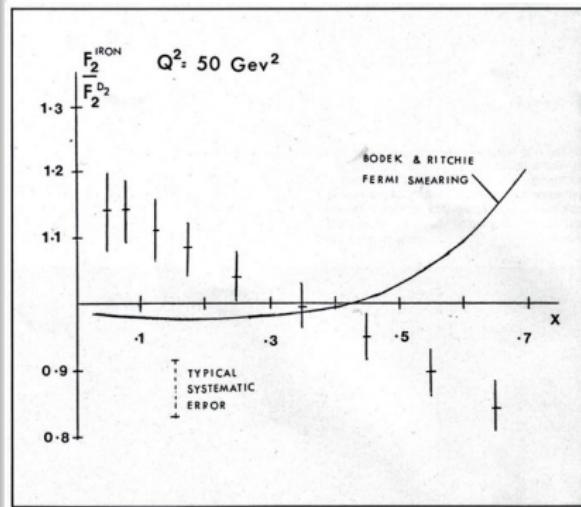

3 Analysis

EMC Effect

European Muon Collaboration's (EMC)
1983 results for the lepton scattering
experiment on Iron and Deuterium.

- Nucleon Structure Functions
- Sea-Quark Distributions e
- Gluon Distributions
- Expected $F_A = NF_2^N + ZF_2^P$
- Because the binding energies of the nucleons are several orders of magnitude smaller than the momentum transfer for an interaction in DIS region
- Fermi interaction causing differentiation at high momentum transfer.

Figure: EMC data of F_2^{Fe}/F_2^D from 1982 [Higinbotham D., 2013].

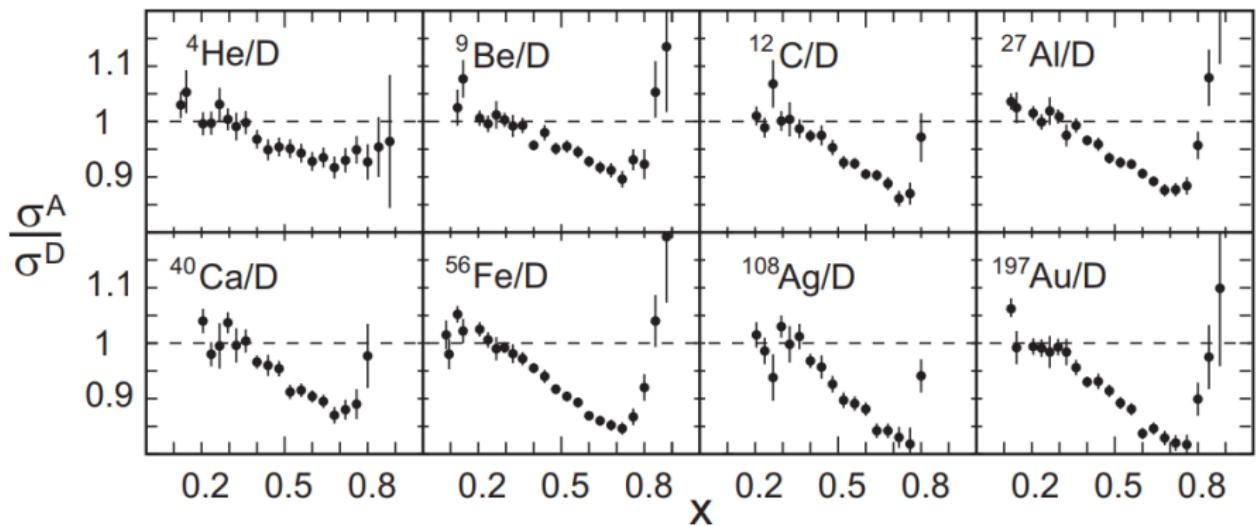

EMC Effect

European Muon Collaboration:

- Nuclear F2 structure function per nucleon different than that of deuterium
- Quark distribution functions modified in the nuclear medium
- Defined the magnitude of the EMC effect as the slope of the $\frac{A}{D}$ per nucleon cross section ratio from 0.3 to 0.7 in x.
- Current Explanations
 - ▶ Binding effects beyond nucleon Fermi motion
 - ▶ Enhancement of pion field with increasing A
 - ▶ Influence of possible multi-quark clusters
 - ▶ Change in the quark confinement scale in nuclei
- No unique/universally accepted theory for explanation of effect up to date.

EMC Effect

Figure: SLAC experiment E139 [J. Gomez et al., 1994].

EMC Effect

Figure: JLab experiment "EMC in light Nuclei" [J.Seely, A. Daniel et al].

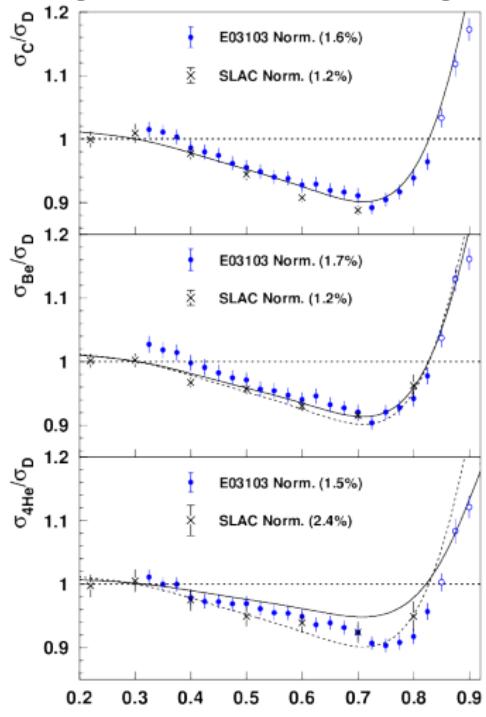

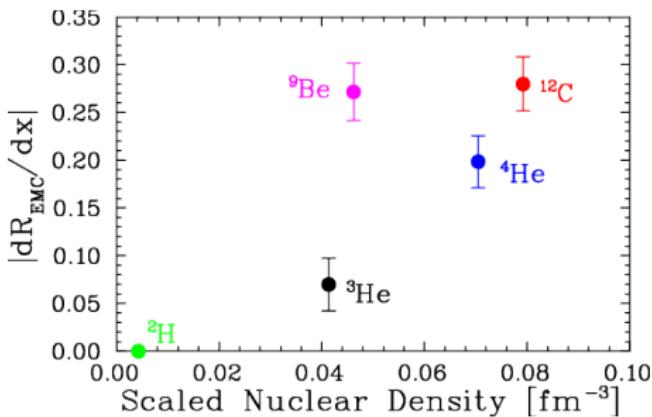

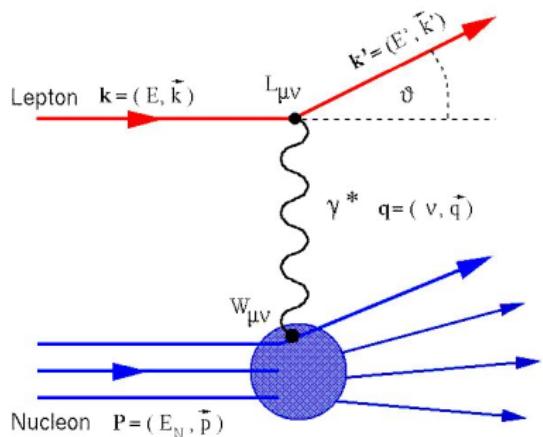

Figure: EMC as a function of Nuclear Density [J.Seely, A. Daniel et al].

Deep Inelastic Scattering (DIS)

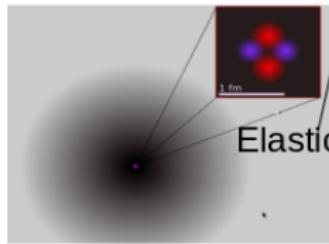

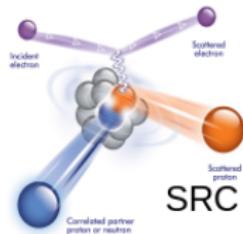

- Momentum Transfer

$$Q^2 \equiv 4EE' \sin^2 \frac{\theta}{2}$$
- Bjorken X (X_{bj}/x) = $\frac{Q^2}{2\nu M}$
- $\sigma_{eN} = \frac{\alpha^2}{eE^2 \sin^4(\frac{\theta}{2})} \left[\frac{F_2}{\nu} \cos^2 \frac{\theta}{2} + \frac{2F_2}{M} \sin^2 \frac{\theta}{2} \right]$
- Invariant Mass

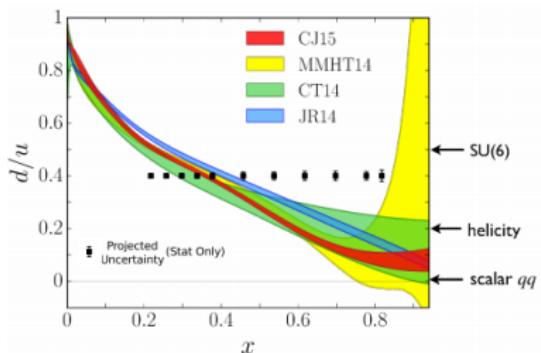

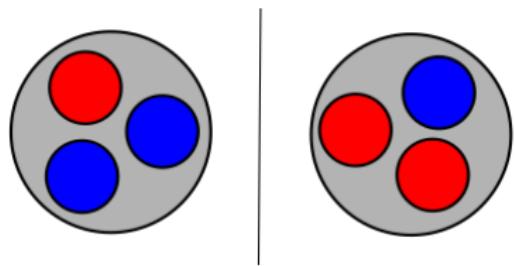

$$W^2 = 2M\nu + M^2 - Q^2$$
- $W^2 > 4 \rightarrow \text{DIS}$

Tritium Experiments

MARATHON

MeAsurement of F_2^n/F_2^p , d/u RAtios and $A = 3$ EMC Effect in Deep Inelastic Electron Scattering off the Tritium and Helium MirrOr Nuclei.

- Lightest and simplest mirror system
 - ▶ Number of protons in 3H = neutrons in 3He
- Differences in the nuclear effects are small
- Improve the current measurement and understanding of Fn2 to F p2 ratio
- Restrict the assumptions and parameters made in the model calculations of the down to up quark distribution ratio

Tritium Target Cell

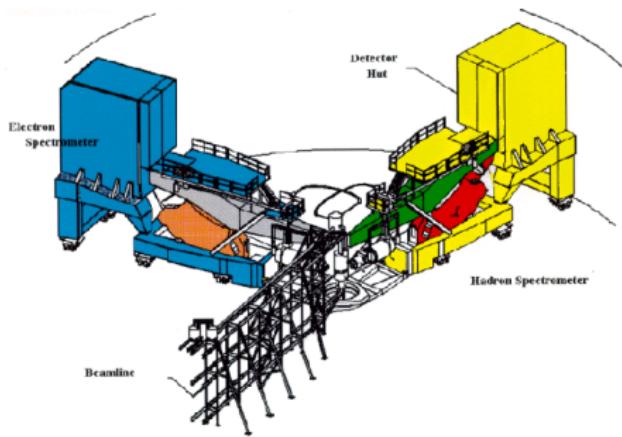

First tritium target at JLab

- Thin Al entrance and exit windows 0.01 inches
- 1090Ci of Tritium (0.1 g)
- 25 cm long
- Tritium Cell was filled in Savannah River
- 40 kelvin Helium is used to cool an attached heat sink

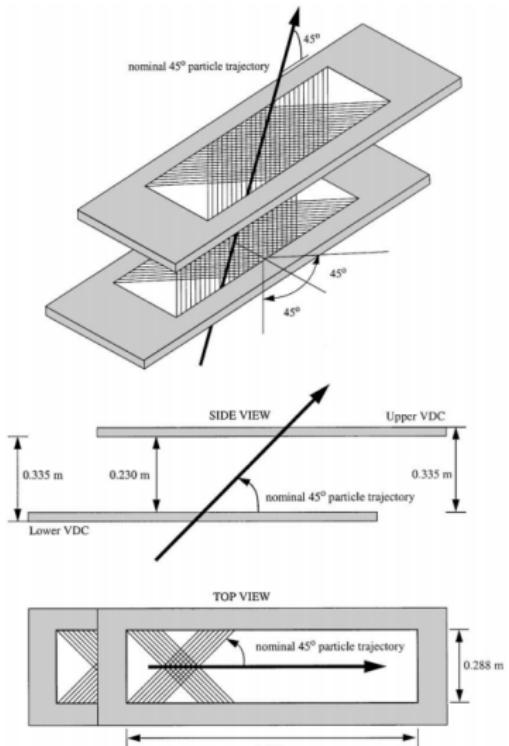

Hall A & The HRSs

Use CEBAF(Continues Electron Beam Facility) to provide 10.6 GeV beam for electron scattering.

Vertical Drift Chamber(VDC)

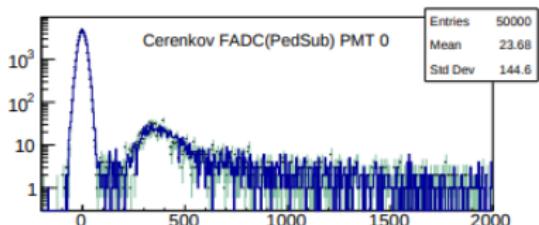

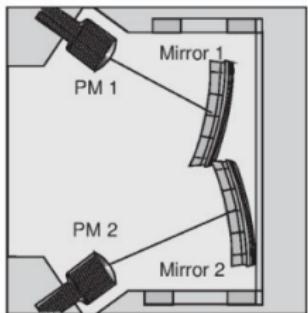

Tracking Detector

A dual VDC system is used to provide precise angular reconstruction of particle trajectories.

- U/V angle $\pm 45^\circ$
- 368 wired per plane
- 4.2mm spacing between wires
- Online Efficiency determined by nearest neighbor method [J. Alcorn et al.]

Gas Cherenkov

PID Detector

- Filled with CO_2
- Index of refraction of 1.00041 and operated at 1 atm
- Electron threshold of 0.017 $\frac{GeV}{c}$
- Pion/proton threshold of 4.8/32 $\frac{GeV}{c}$
- 1.5/1 m radiator length of left/right arm [J. Alcorn et al.]

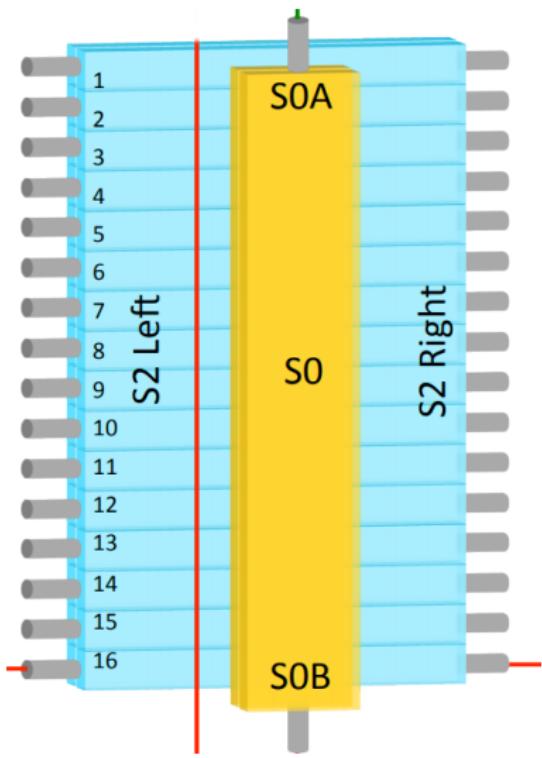

Calorimeter

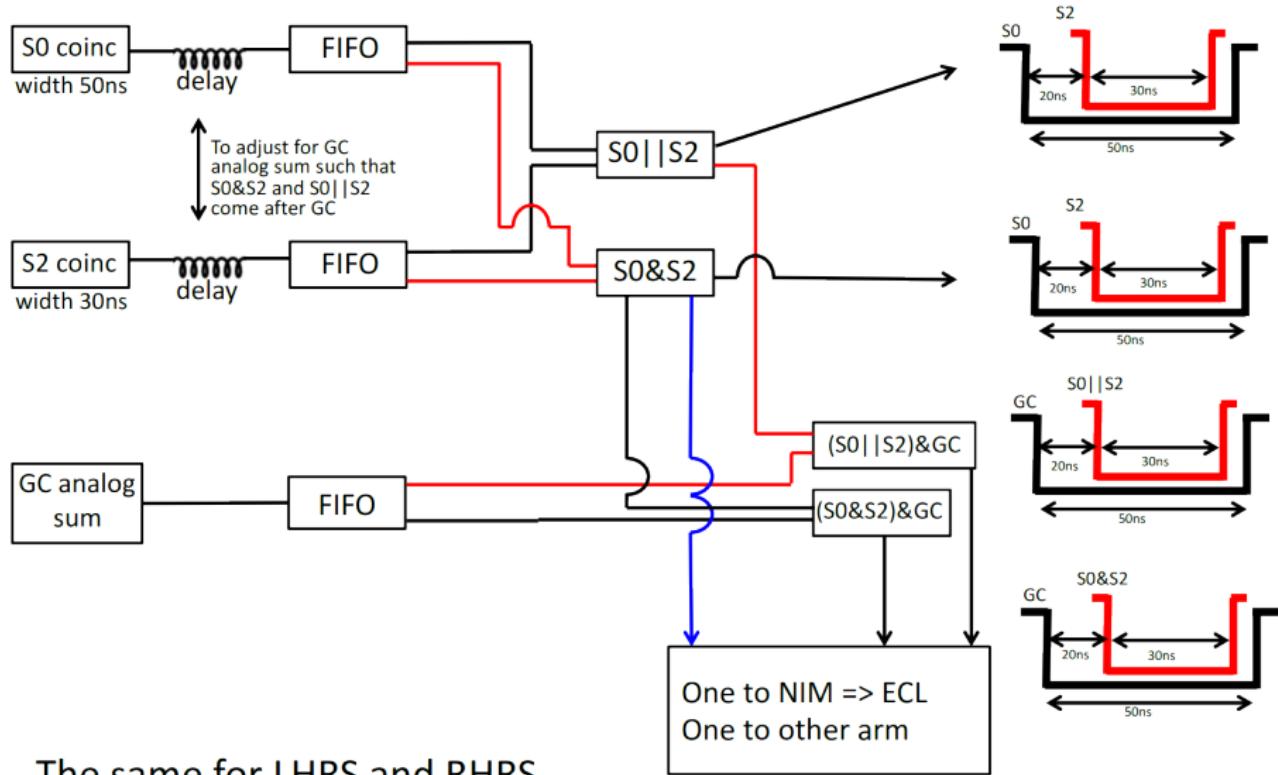

Scintillators

Trigger

- Two Scintillating light detectors
 - ▶ S0 large acceptance and low resolution
 - ▶ S2 16 bars capped by PMTs
- Main source for trigger
- Provide TOF(time of flight) & Used to help identify hadrons [J. Alcorn et al.]

Single Arm Triggers ($S_0 \& S_2$); $(S_0 \& S_2) \& GC$; $(S_0 \mid\mid S_2) \& GC$ 

The same for LHRS and RHRs

Figure: By Florian Hauenstein

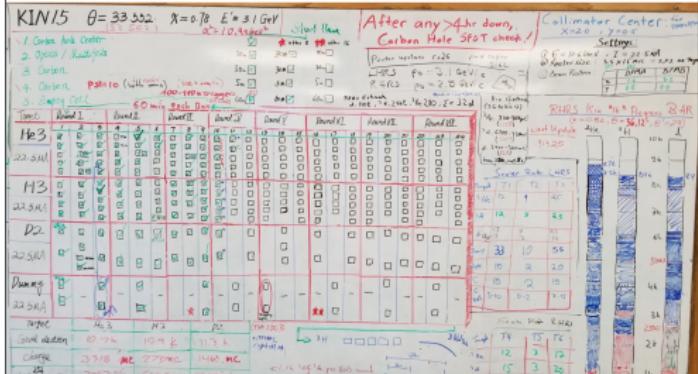

The Run Period

Rey Torres

- Ran from January 11th to April 12th of 2018.
- Gaseous Tritium, Deuterium, Helium-3, and Hydrogen
- Single Carbon Foil, Carbon foil with hole, and multi-foil
- Rotated through targets to achieve equal statics and reduce the impact of unforeseen circumstances

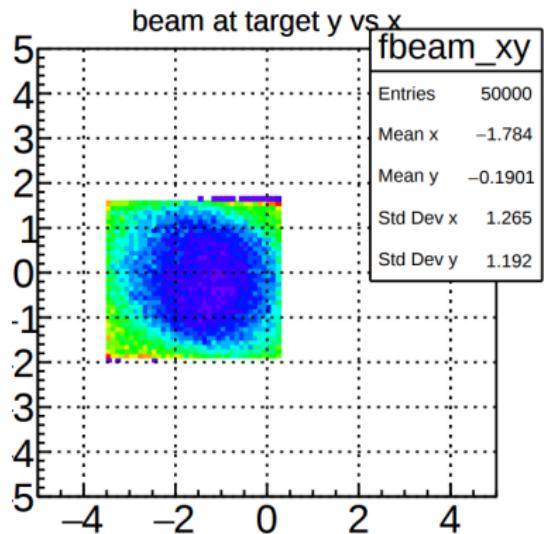

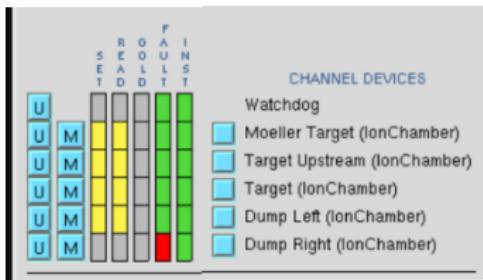

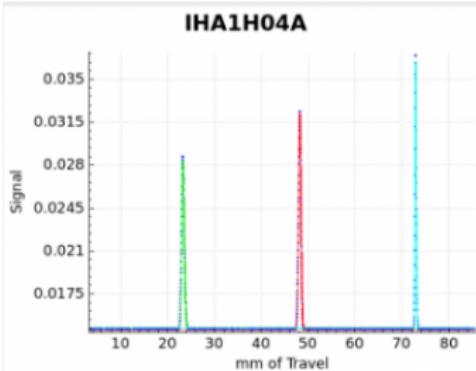

Major Miscues

- Right Arm Dipole failed on January 11th
 - ▶ Return the dipole to functionality the following day
 - ▶ 01/13 - Dipole failed again, causing a chain reaction with the Left arm
 - ▶ Solution could not be found quickly
 - ▶ Change of Kinematic plan to use single HRS.
 - ▶ Recovered RHRS on 01/16 - Set to take data at theta of 36.12° , x of 0.82
- A Transformer Failed on March 5th
 - ▶ Recovered on March 23rd
 - ▶ Spring run Period extended by 18 days
 - ▶ MARATHON took opportunistic data during recovery period

Tritium Safety Requirements

- Harp and BPM Check!
- Ion Chamber functionality test
- Beam Center
- Raster Size calibration.

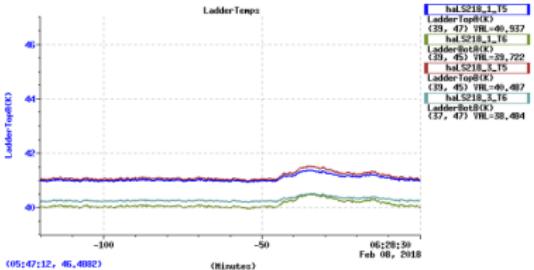

Run #1894

L-arm S2m TDC (8-15)

T1	$1.27e+01$	T2	$2.99e+00$	T3	$2.49e+01$
(S0/S2)R	$3.01e+03$	L1A_Remote	$2.30e+01$	Clock_RHRS	$1.02e+03$
Sh-Sum	$3.37e+01$	(S0/S2)L	$2.48e+03$	S2L	$2.80e+03$
(S0/S2)R	$3.01e+03$	ADC_gate	$3.47e+01$	L1A	$1.76e+03$

Shift Crew Task

- Monitor Detector plots
- Record and observe event frequency
- Observe target response including the temperature sensor attached to the target ladder.

Analysis

Data Analysis Task

- Data decoding
- Online analysis
- Full detector calibrations
- Detector efficiencies
- Systematic Studies

Monte Carlo Analysis

- Monte Carlo Tuning
 - Offsets
 - Target Parameters
 - Reconstruction functions
- Event weighting
- Acceptance studies

- Cross section extraction through Data to Monte Carlo ratio method
- Compare Cross Section of A=3 Nuclei to that of Deuterium to calculate EMC effect

Data Decoding

The Hall A Analyzer

```

- An object-oriented, modular framework built on top of ROOT.
- Use modular classes to build a detector package
- Libraries to calculate physics variables

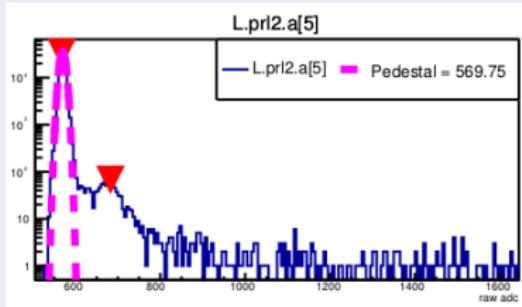

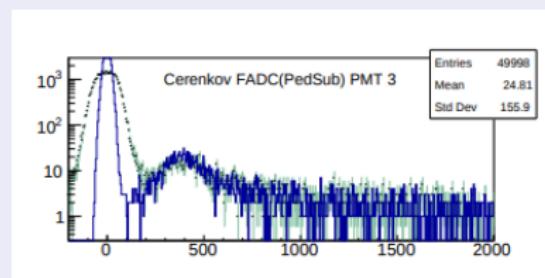

- THaRasterBeamClass
- THaCherenkov
- THaTrackingDetector

- Tri_Beam_Eloss
- TriBCM
- TriFADCBPM

Online Analysis

- Quick Calibrations
- Electron Counts
- Comparable plots for detector checks

Detector Calibrations

Figure: BPM pedestals

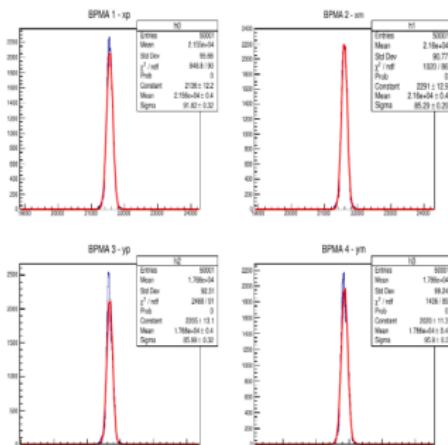

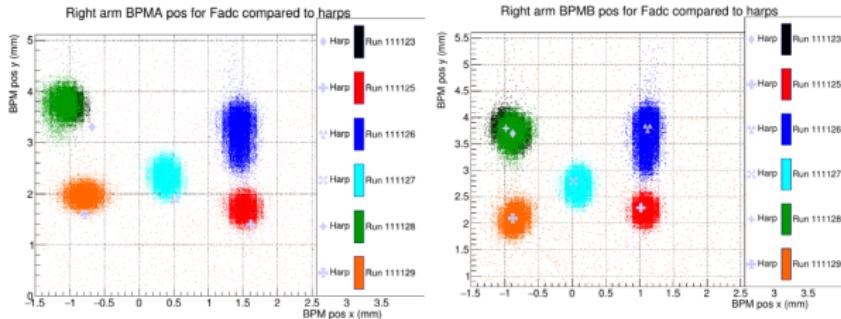

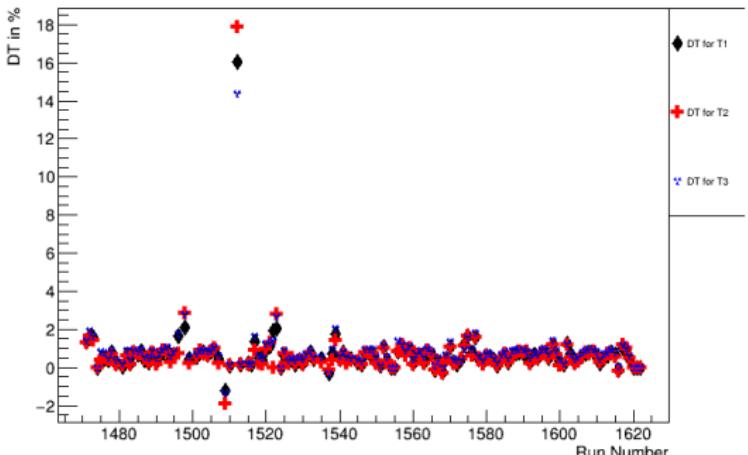

Figure: Before and After

Efficiencies

- Particle ID
- Tracking Efficiency
- Dead Time
- Trigger Efficiency

Systematic Studies

Figure: Density Fluctuations

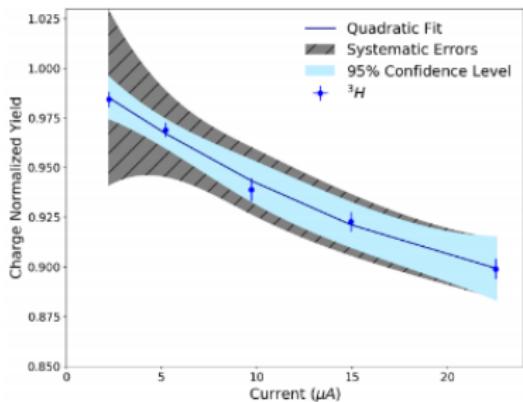

Figure: Tritium beta decay

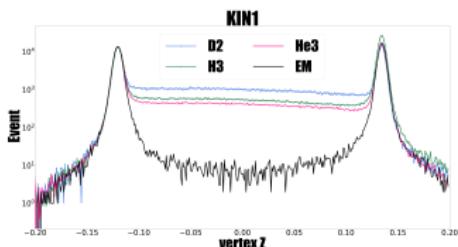

Figure: End Cap Contamination

Figure: Charge Symmetric background

Yield Extraction

Number of detect

$$Yield_{data} = \frac{(N_e - BackGround)}{Efficiency}$$

$$\frac{d\sigma}{d\Omega dE'} = \sigma^{mod} * \left[\frac{Yield_{data}(E', \theta)}{Yield_{MC}(E', \theta)} \right]$$
