

$\frac{F_2^n}{F_2^P}$ Ratios from MARATHON

Jason Bane

University of Tennessee

jbane1@vols.utk.edu

August 28, 2019

Agenda for the Workshop on Experiments with Tritium at JLab

Sept. 20-21, 1999 at JLab

9/20/99 Monday afternoon [Chair - Ron Ransome (Rutgers)]
Location: Auditorium, CEBAF Center

13:00 Measurement of the Tritium Elastic Form Factors at Saclay
Jacques Martino (Saclay)

13:30 Unpolarized Measurements: Elastic Form Factors, R_L-R_T Separation, and the Coulomb Sum Rule
Cathleen Jones (Caltech)

13:50 Polarization Observables in Quasielastic Scattering
Steffan Strauch (Rutgers)

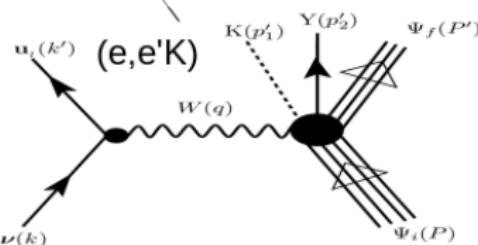

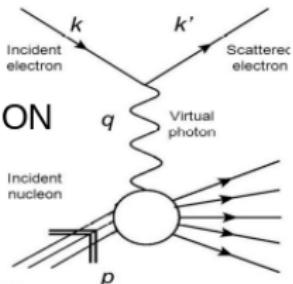

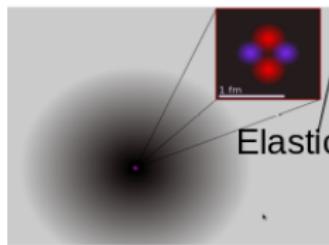

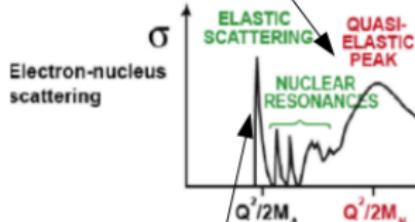

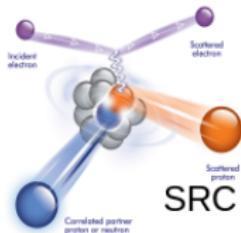

14:30 break

14:50 Kaon Electroproduction on Tritium
Joerg Reinhold (FIU)

15:30 Measurement of the Ratio (σ_{en}/σ_{ep}) at High x using a Tritium Target at JLab
Makis Petratos (Kent State) [with J. Gomez, M. Katramatou, and W. Melnitchouk]

16:10 Measurements of the GDH Sum Rule on the 3-body Nuclei at JLab
J.-P. Chen (TJNAF)

Tritium Experiments

MARATHON

MeAsurement of F_2^n/F_2^p , d/u RAtios and $A = 3$ EMC Effect in Deep Inelastic Electron Scattering off the Tritium and Helium MirrOr Nuclei.

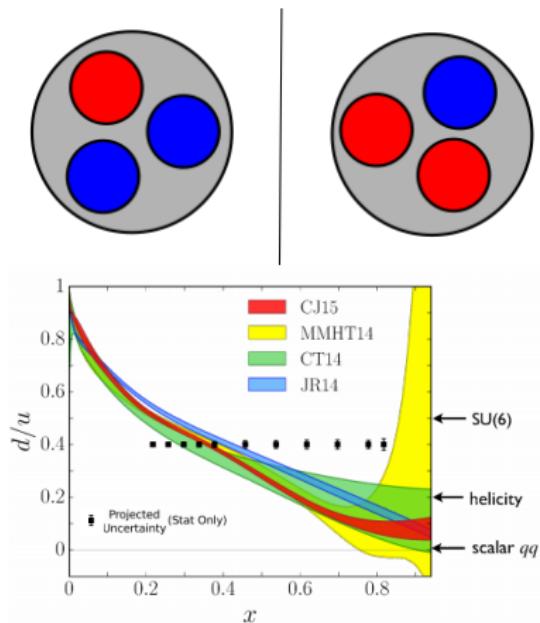

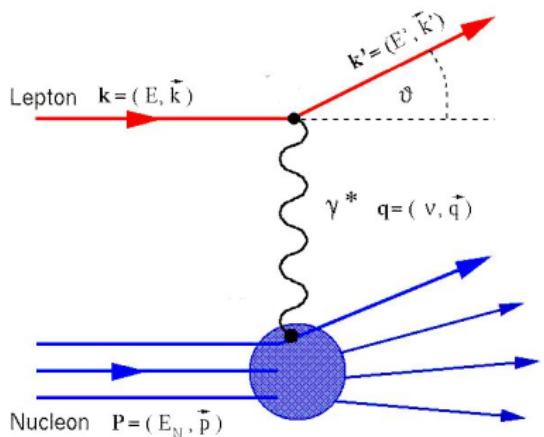

Figure: d/u quark distribution ratios

Deep Inelastic Scattering (DIS)

- Momentum Transfer

$$Q^2 \equiv 4EE' \sin^2 \frac{\theta}{2}$$
- Bjorken X (X_{bj}/x) = $\frac{Q^2}{2\nu M}$
- $\sigma_{eN} = \frac{\alpha^2}{eE^2 \sin^4(\frac{\theta}{2})} \left[\frac{F_2}{\nu} \cos^2 \frac{\theta}{2} + \frac{2F_1}{M} \sin^2 \frac{\theta}{2} \right]$
- Invariant Mass

$$W^2 = 2M\nu + M^2 - Q^2$$
- $W^2 > 4 \rightarrow \text{DIS}$

$\frac{F_2^n}{F_2^p}$ in the Quark Parton Model

- Assume isospin symmetry:

$$u^p(x) \equiv d^n(x) \equiv u(x) \quad \bar{u}^p(x) \equiv \bar{d}^n(x) \equiv \bar{u}(x)$$

$$d^p(x) \equiv u^n(x) \equiv d(x) \quad \bar{d}^p(x) \equiv \bar{u}^n(x) \equiv \bar{d}(x)$$

$$s^p(x) \equiv s^n(x) \equiv s(x) \quad \bar{s}^p(x) \equiv \bar{s}^n(x) \equiv \bar{s}(x)$$

- Proton and neutron structure functions:

$$F_2^p = x \left[\frac{4}{9}(u + \bar{u}) + \frac{1}{9}(d + \bar{d}) + \frac{1}{9}(s + \bar{s}) \right]$$

$$F_2^n = x \left[\frac{4}{9}(d + \bar{d}) + \frac{1}{9}(u + \bar{u}) + \frac{1}{9}(s + \bar{s}) \right]$$

- Nachtmann inequality: $1/4 \leq F_2^n / F_2^p \leq 4$

SLAC/CERN Data Interpretation in QPM

- Nachtmann inequality satisfied: $1/4 \leq F_2^n / F_2^p \leq 4$

- For $x \rightarrow 0$: $F_2^n / F_2^p \rightarrow 1$: Sea quarks dominate with:

$$u + \bar{u} = d + \bar{d} = s + \bar{s}$$

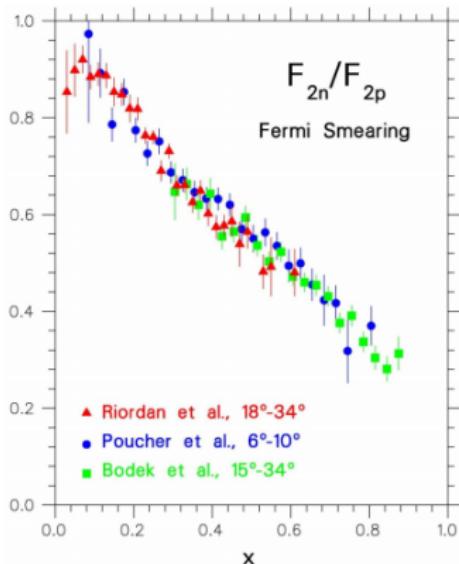

- For $x \rightarrow 1$: $F_2^n / F_2^p \rightarrow 1/4$: High momentum partons in proton (neutron) are up (down) quarks, and:

$$s + \bar{s} = 0$$

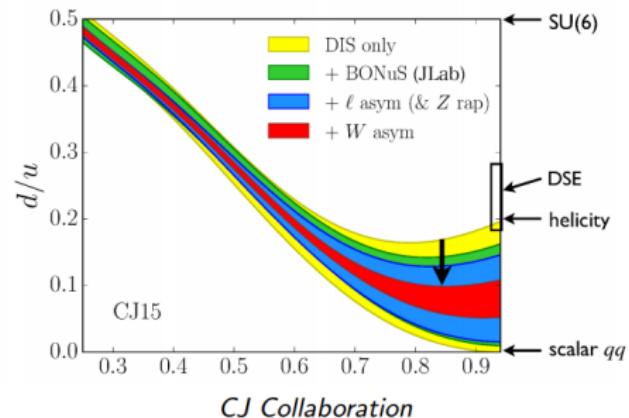

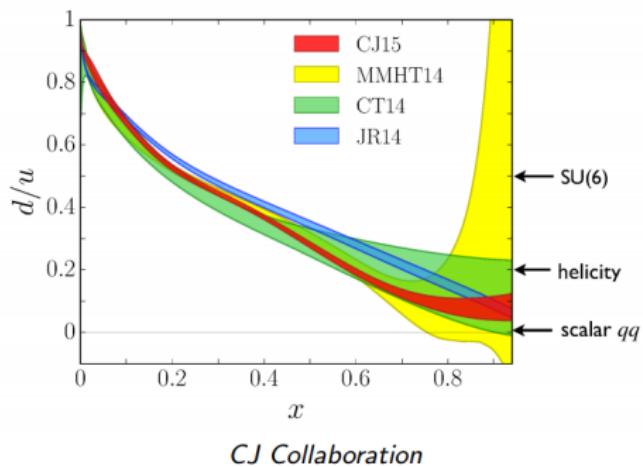

- For medium and high x , safe to assume that (with d and u denoting now quark plus antiquark distributions):

$$\frac{F_2^n}{F_2^p} = \frac{[1 + 4(d/u)]}{[4 + (d/u)]}$$

More than 140 Collaborators

Red-Boldfaced Names: Tritium Program grad students; **starred:** MARATHON Ph.D. students

Blue-Boldfaced Names: Tritium Program postdoctoral associates

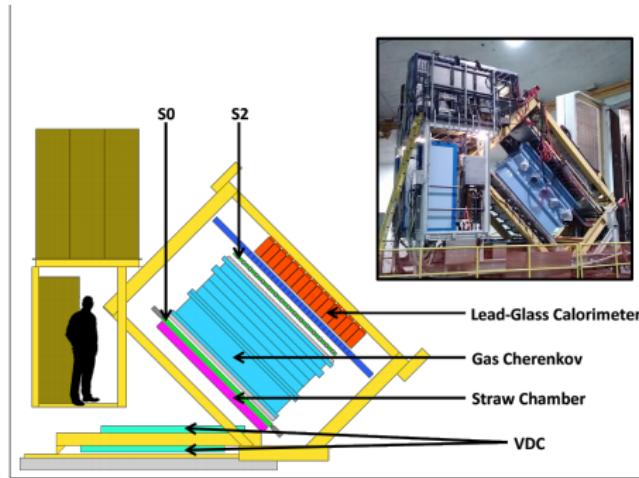

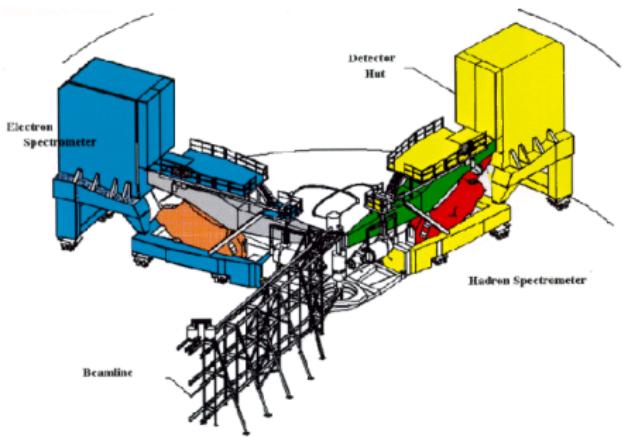

The JLab MARATHON Tritium Collaboration

Forty Five Institutions (in no particular order): University of Virginia; Texas A & M University; Kent State University; University of Zagreb; California State University, Los Angeles; Argonne National Laboratory; Temple University; The College of William and Mary; University of Tennessee; Massachusetts Institute of Technology; INFN Sezione di Catania; INFN Sezione di Roma, INFN Sezione di Pisa; Mississippi State University; Hampton University; Florida International University; Old Dominion University; Jefferson Lab; University of Perugia; Tel Aviv University; University of Connecticut; Tohoku University; Columbia University; Cairo University; Ohio University; Stony Brook, State University of New York; Syracuse University; Nuclear Research Center-Negev, Beer-Sheva; Institute for Nuclear Research of the Russian Academy of Sciences; University of New Hampshire; University of Regina; Columbia University; Facility for Rare Isotope Beams, Michigan State University; Los Alamos National Laboratory; University of Idaho; University of Pisa; Jožef Stefan Institute, University of Ljubljana; Johannes Gutenberg-Universität Mainz; Saint Norbert College; Center for Neutrino Physics, Virginia Tech; University of South Carolina; Kharkov Institute of Physics and Technology; Norfolk State University; Rutgers University; Artem Alikhanian National Laboratory; Tel Aviv University; Northern Michigan University; University of Illinois, Chicago.

Twelve Countries: Armenia, Canada, Croatia, Egypt, Germany, Israel, Italy, Japan, Russia, Slovenia, Ukraine, United States.

Hall A & The HRSs

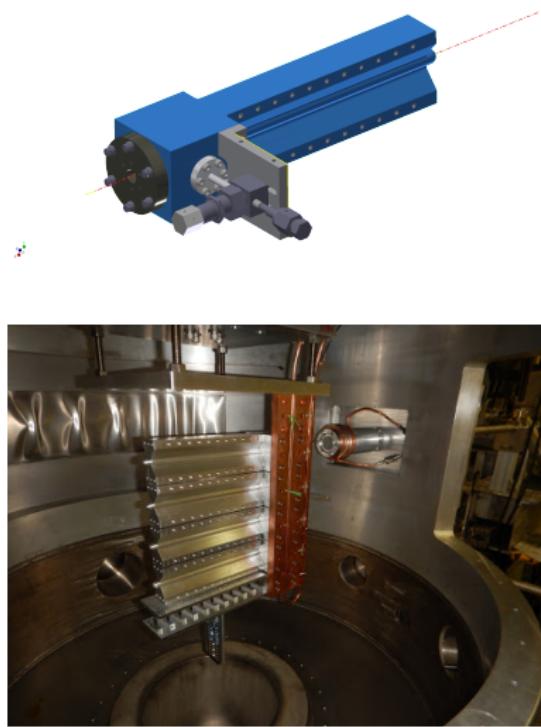

Use CEBAF(Continues Electron Beam Facility) to provide 10.6 GeV beam for electron scattering.

Tritium Target Cell

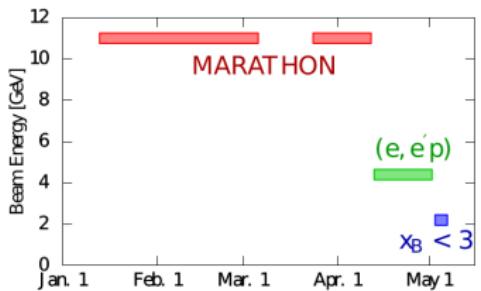

First tritium target at JLab

- Thin Al entrance and exit windows 0.01 inches
- 1090Ci of Tritium (0.1 g)
- 25 cm long
- Tritium Cell was filled in Savannah River
- 40 kelvin Helium is used to cool an attached heat sink

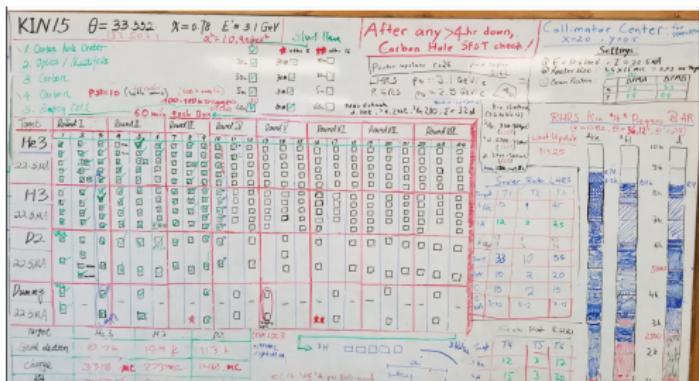

The Run Period

- Ran from January 11th to April 12th of 2018.
 - Gaseous Tritium, Deuterium, Helium-3, and Hydrogen
 - Single Carbon Foil, Carbon foil with hole, and multi-foil
 - Rotated through targets to achieve equal statics and reduce the impact of unforeseen circumstances

Rey Torres

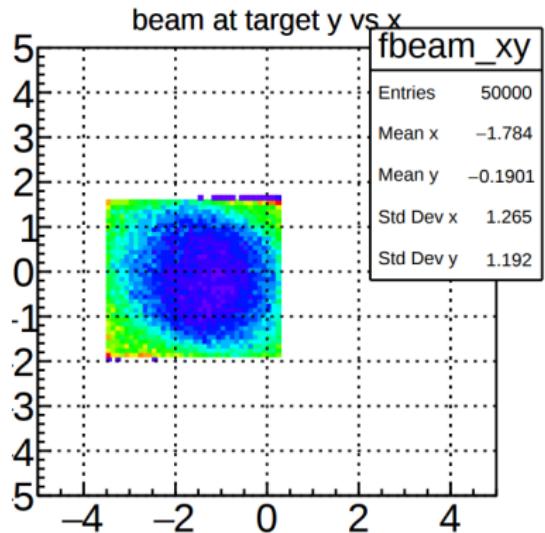

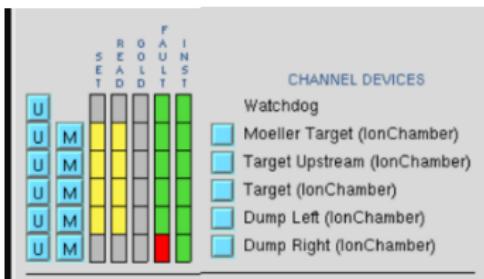

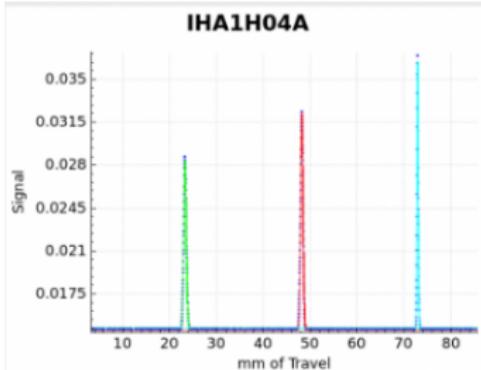

Major Miscues

- Right Arm Dipole failed on January 11th
 - ▶ Return the dipole to functionality the following day
 - ▶ 01/13 - Dipole failed again, causing a chain reaction with the Left arm
 - ▶ Solution could not be found quickly
 - ▶ Change of Kinematic plan to use single HRS.
 - ▶ Recovered RHRSS on 01/16 - Set to take data at theta of 36.12°, x of 0.82
- A Transformer Failed on March 5th
 - ▶ Recovered on March 23rd
 - ▶ Spring run Period extended by 18 days
 - ▶ MARATHON took opportunistic data during recovery period

Tritium Safety Requirements

- Harp and BPM Check!
- Ion Chamber functionality test
- Beam Center
- Raster Size calibration.

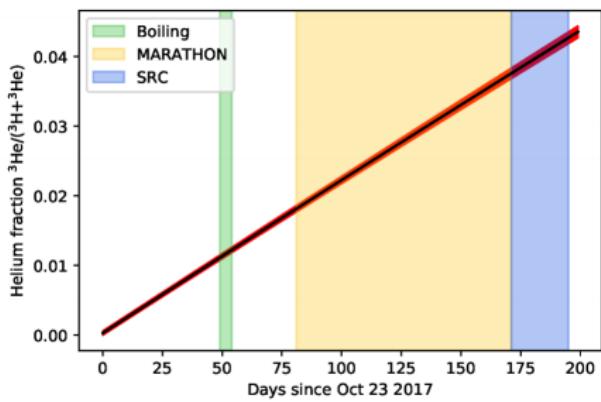

Systematics: 3H Decay

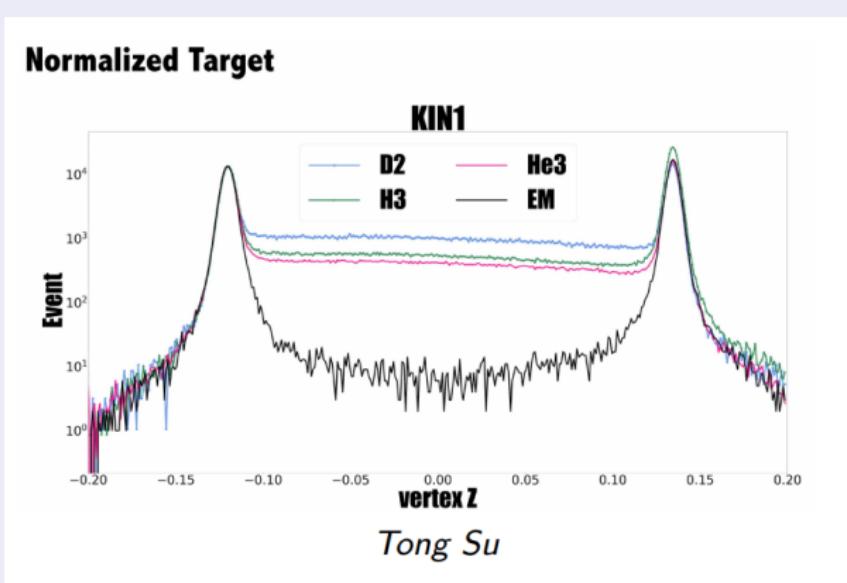

$$\tau^3He = 4500 \pm 8\text{ days}$$

$$c = \frac{\eta^3He}{\eta_{tot}}$$

$$\sigma^3H = \left(\frac{\sigma_{tot}}{\sigma^3He}\right) \left(\frac{1}{1-c}\right) - \left(\frac{1}{1-c}\right)$$

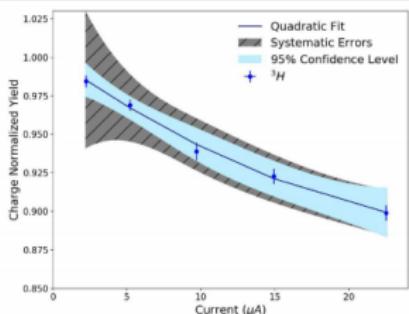

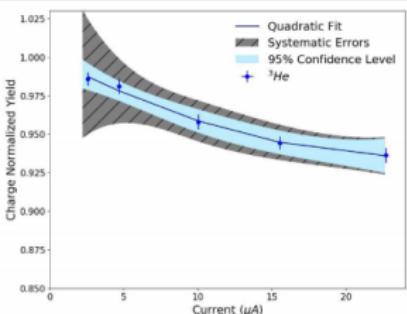

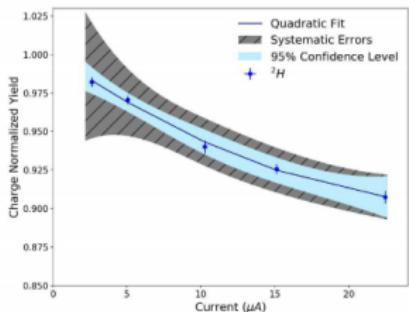

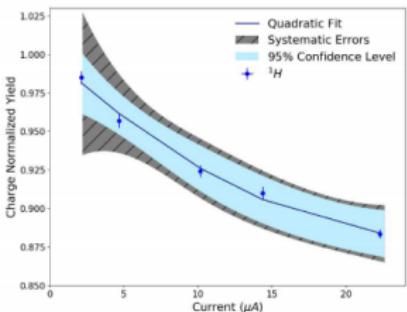

Systematics: Endcaps

- Extract ratio of the normalized yield from the gas cell to that of the empty cell

Systematics: Density Fluctuations

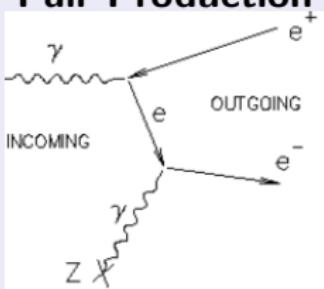

(a) ${}^3\text{H}$ Density Analysis.(b) ${}^3\text{He}$ Density Analysis.(c) ${}^2\text{H}$ Density Analysis.(d) ${}^1\text{H}$ Density Analysis.

Santiesteban et al

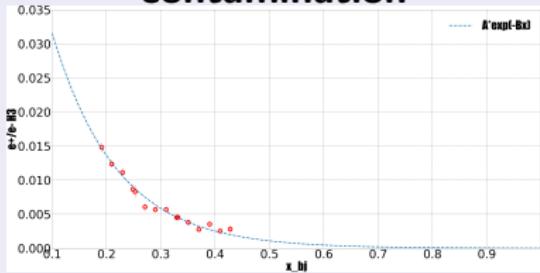

Charge Symmetric back ground

- High energy photons decay into an e^+e^- pairs
- Account for the pair produced e^- by detecting the pair produced e^+
- HRS positive polarity - kinematics 1,2 and 3
- Fit results with an exponential function to determine the contamination factor at high x_{Bj} kinematics.

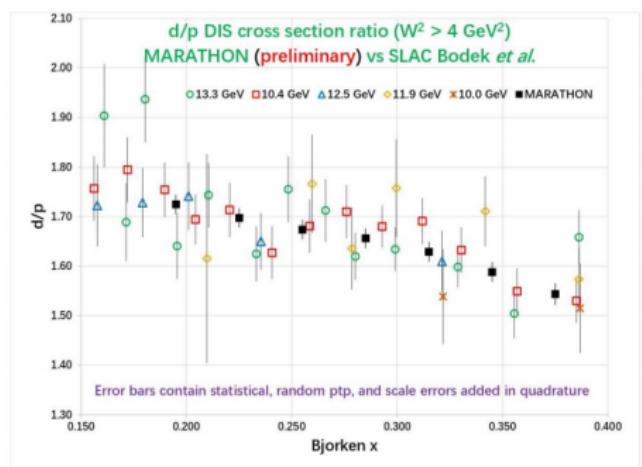

Pair Production

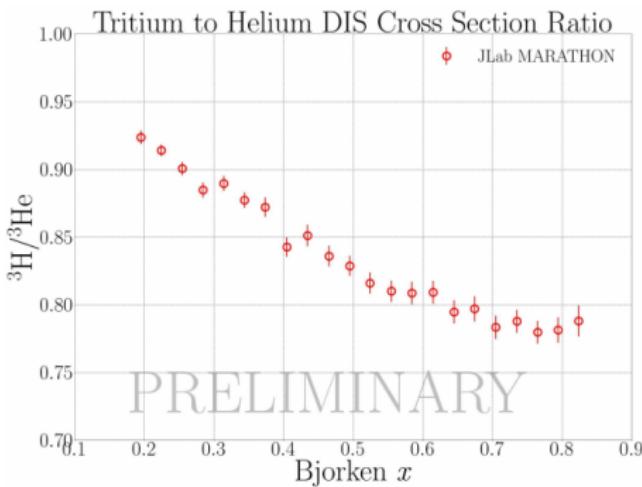

Tritium positron contamination

Extracting F2

- Form the “SuperRatio” of EMC-type ratios for $A=3$ mirror nuclei:

$$R(^3He) = \frac{F_2^{^3He}}{2F_2^p + F_2^n} \quad R(^3H) = \frac{F_2^{^3H}}{F_2^p + 2F_2^n} \quad R^* = \frac{R(^3He)}{R(^3H)}$$

- Solve above equations for the $A=3$ structure function ratio:

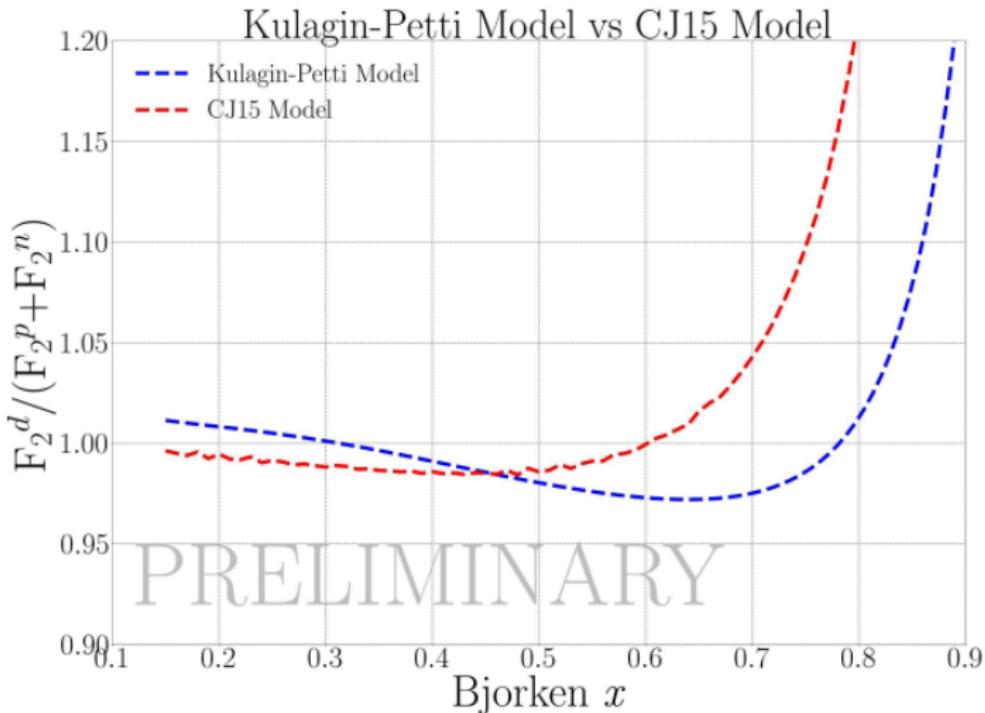

$$\frac{\sigma^{^3He}}{\sigma^{^3H}} = \frac{F_2^{^3He}}{F_2^{^3H}} = R^* \frac{2F_2^p + F_2^n}{F_2^p + 2F_2^n}$$

- Solve for the nucleon F_2 ratio and calculate it, using R^* from a reliable theoretical model (value of R^* is very close to unity with small uncertainty), and the measured $A=3$ DIS cross section ratio:

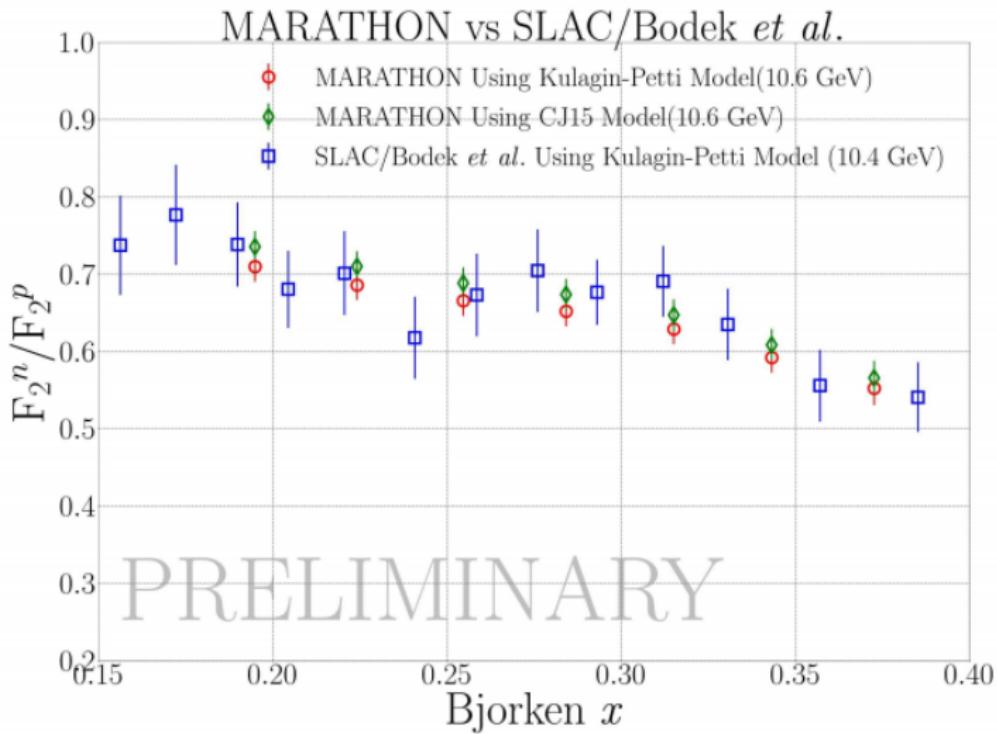

$$\frac{F_2^n}{F_2^p} = \frac{2R^* - \sigma^{^3He}/\sigma^{^3H}}{2\sigma^{^3He}/\sigma^{^3H} - R^*}$$

- Iterate the process until it converges to a stable F_2^n/F_2^p ratio.

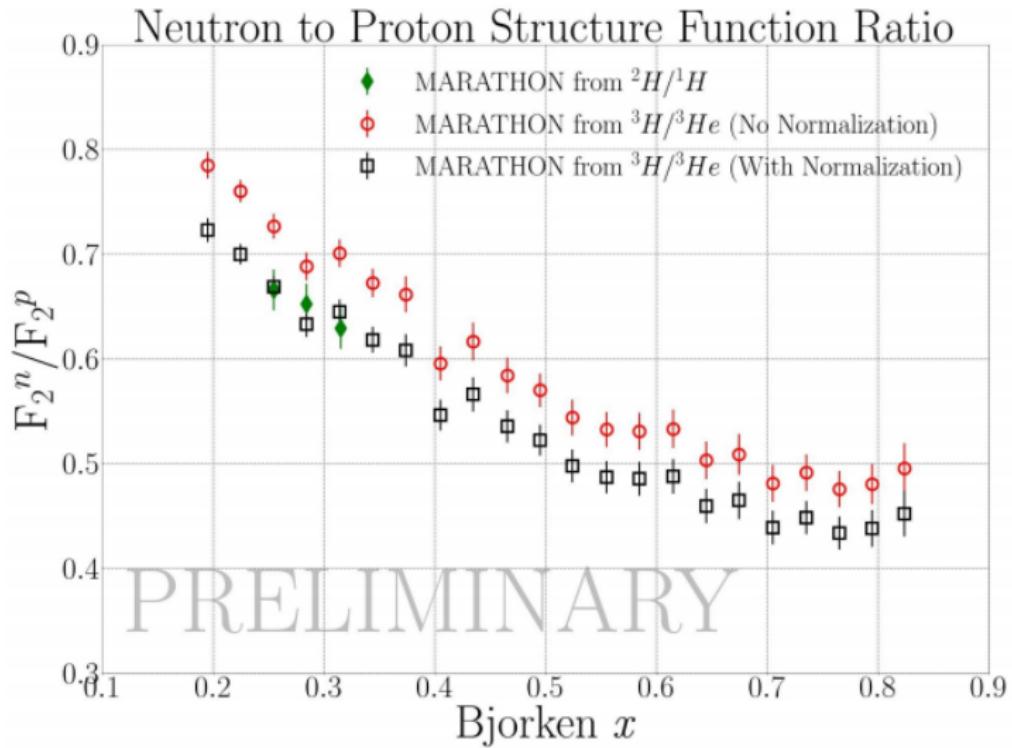

Extracting F2

F_2^n / F_2^p for D/p

plot credit: Tong Su

$$\frac{F_2^n}{F_2^p}$$

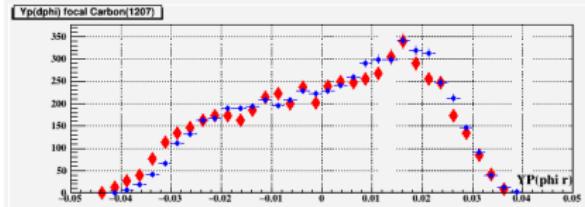

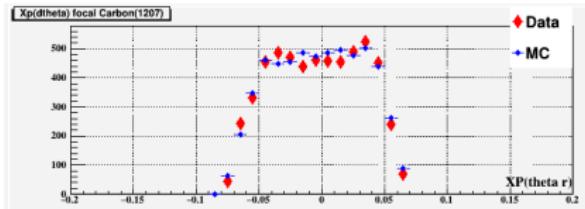

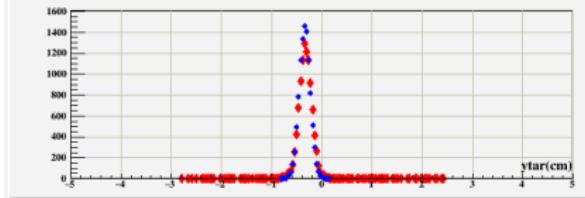

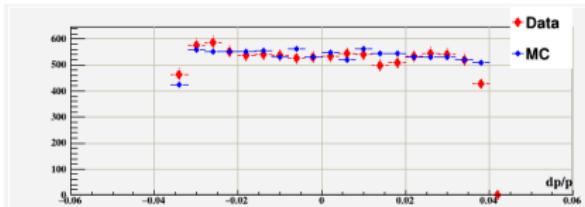

PRELIMINARY

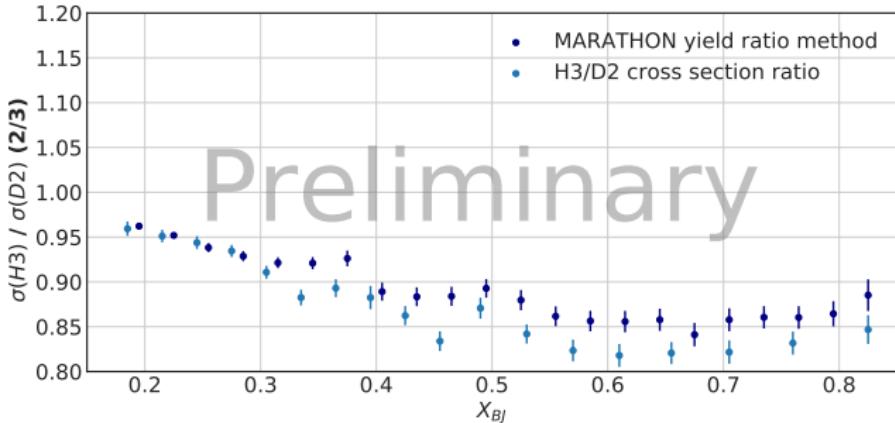

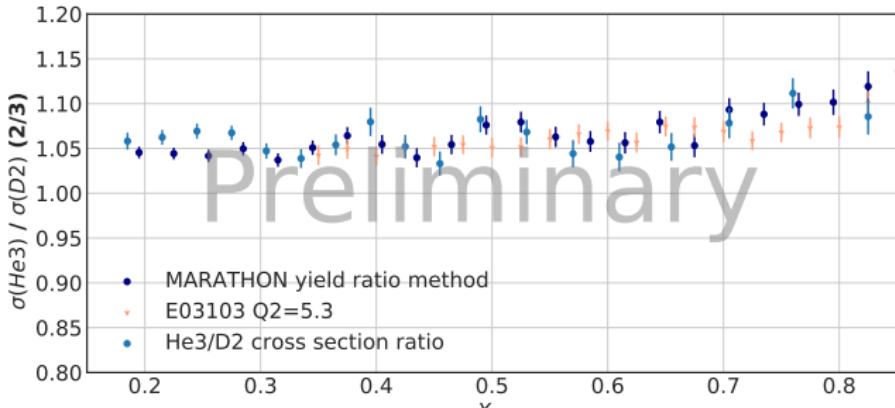

plot credit: Tong Su

Monte Carlo

- Generate events in target space
- Pass through detector aperture
- Use optics matrix to project back to target from focal plane.
- Tune Simulation to match detector response
- Adjust initial parameters
- Use model to weight events
 - ▶ Deep Inelastic and resonance region from Bodek Fit
 - ▶ Quasi elastic model of F1F2QE09

EMC Effect

Thank you!!

- MARATHON students
- Tritium collaboration
- Hall A Collaboration
- Hall C Collaboration that took shifts during MARATHON
- Nadia Fomin and Doug Higinbotham
